FROM \$649

FFP Mil Pro II (15x) Reticle

Developed specifically for first focal plane optical systems and based around the common principles of Mil spaced reticles. With half Mil spaced markings extending out to 10 Mil of holdover, the FFP Mil Pro is a versatile reticle that provides aim points no matter how extreme the distance.

SAFETY

By Tom Gaylord

As shooters there is one thing that should rise above all others in our lives—safety. Shooting can be a very safe pastime only if some simple rules are followed. In this article I'm going to talk about safety, not in general terms but very specifically. One rule stands above all the rest. ALWAYS POINT THE MUZZLE OF A GUN AT SOMETHING YOU WANT TO SHOOT!

Wait a minute! That's not what the rule says, Tom. It says to always point the muzzle of a gun in a safe direction. The reality is there ARE NO safe directions! Always assume the gun WILL FIRE and make sure it is pointed at something you don't mind shooting. But wait, you say. What if I don't want to shoot at ANYTHING yet? If I assume that there are NO safe directions, what can I do? Ahh, Grasshopper, you're starting to learn! Before you write Pyramyd AIR requesting a refund for the price you paid for this catalog, let's discuss this topic a bit.

Safeties Fail

Your airgun may have a mechanical safety. Do mechanical safeties ever fail? Anything made by man is subject to failure, so the answer has to be yes. A few books about shooting written a century and longer ago deal with this but in this case it's better to hear from someone with experience than to read it in a book. So, if you don't have the experience of a failed safety or an unwanted discharge yet, ask a shooter with lots of trigger time

because sooner or later a failed safety happens to all of us. Not only can safeties fail, they can also be circumvented by ambitious people who find ways around them for one reason or another. These may be people you don't even know who did things to the airgun before it came to you. For example, some folks don't like safeties that come on automatically when a gun is cocked so they take steps to disable them. Some of those steps may put the next operator of the gun (you) in harm's way, but such things are never documented. So, when you handle a gun for the first time ALWAYS POINT THE MUZZLE AT SOMETHING YOU DON'T MIND SHOOTING!

What if...

What if there is nothing around you that you want to shoot? That's simple—DON'T MAKE THE GUN READY TO SHOOT. Don't load it. Don't cock it. And don't let it out of your control.

Stories from Experience

Okay, here we go. I have a multi-pump pneumatic rifle that is about 80 years old. It looks like new on the outside because of beautiful refinishing, but the man who refinished it admitted that the internal trigger parts were quite worn. While I was shooting it one day recently, BAM! The trigger slipped and the gun fired. Now I have a hole in one of the walls of my house. Well, of all the places in my house that wall was one I didn't mind shooting. And what I mean by that is if I had to pick a place in the house to get shot at least it wasn't a window, or the television, or another person! Or what about the guy who took apart the trigger on his AirForce TalonSS and smoothed all the parts with a stone and then put molybdenum grease on them? He shot himself in the foot when that trigger slipped off the cocked position. Of course he had already removed the automatic safety before that—because who needs a safety?

Trigger Modifications

Hey, a guy tells you—I know how to make the trigger on your airgun as smooth as butter and as crisp as toast. Just file the rough edges of the trigger parts and the sear (the thing the trigger acts on) smooth and then polish them both until they shine. After that just smear this special grease on both surfaces and feel how smooth and light the trigger is! Yeah! It's so light and smooth it doesn't even have to be touched to go off! I have a hole in the ceiling of my office from that one.

But wait, there is another thing you can do, and it doesn't involve filing or polishing anything. All you have to do is get this special longer screw and install it in your airgun's trigger mechanism. The factory doesn't want your trigger to adjust as light as it was designed to, so they installed a shorter trigger adjustment screw that they know will keep the trigger stiffer than what you want. They did that because their lawyers told them to. This longer screw I'll sell you is guaranteed to fix that.

Don't do it that way

No, no, they tell you. That's not the best way to fix your trigger. Simply take the trigger return spring out and cut it shorter. How much? Oh, cut it to about half its factory length. Don't worry—you can always stretch it if you need more tension for some reason.

You are the safety!

When it comes to shooting, folks, you are the safety for everyone around you. Never assume others know safe practices. You are the range safety officer.

Summary

In this brief article we have looked at safety from an equipment standpoint. That's very important, but don't overlook operational safety and things like all people in the shooting area wearing eye protection. And we have not addressed that all people should respect the shooting area—the firing line, the backstop and all entrances and exits into and out of the area. Our hobby is only as safe as we make it. The ball is in your court!

WHY LEARN TO USE OPEN SIGHTS?

By Tom Gaylord

If you were born in this millennium chances are you don't shoot with open sights. Oh, you may know how to use them, but you don't like to.

What you like are telescopic sights!

With a scope you can see your target so much better and if the scope is a good one you can be as accurate as it is possible to be. Sometimes there are problems like too little light to see the crosshairs, but illuminated reticles can fix that one. And most of the time the scope helps you shoot your best.

However

But what if your scope breaks? In the 65 years I have been shooting I have had scopes "break" several times. I put quotes around the word break because the scope doesn't always actually break. Sometimes I adjust it outside its working range and it simple becomes very inaccurate. Or the scope magnifies so much I lose sight of the target. That usually happens when hunting. And other times it can't be adjusted for what I need to do. That can happen on long-distance shots.

Dot Sights

Okay, you say, what about using dot sights as a backup for scopes? Most of them have a large window with little or no magnification so I won't lose sight of the target. And tests have shown them to be almost as accurate as scopes—especially at close range.

Open Sights

But what about open sights? If you know how to use them can't they be accurate, too? Yes they can and every shooter should learn how to use them to the point they feel comfortable with them. Why? For several reasons we'll now explore.

No batteries

Open sights don't use batteries, so they are always ready to go. Most scopes can also be used without batteries, but most dot sights cannot.

Kentucky Windage

If you learn to use open sights well and if you are familiar with a certain air rifle you can use "Kentucky windage" (aiming off the target to hit it) much easier than you can aim off with a scope.

As you increase the magnification of a variable scope the aim-off changes dramatically. And the ability to hit the target when small sight corrections need to be made is a useful skill to know when hunting or eliminating pests.

The original sights on Kentucky rifle (circa 1730) were crude like this. But with practice the shooters could do quite well with them.

This could be the sight picture when a shooter uses Kentucky windage. If a shooter knows his rifle crude open sights like this can be as accurate as a scope at reasonable ranges.

Bottom Line

As a final note, why do the armed forces of the world rely on open sights over scopes or dot sights? They do so for reliability and for dependability. If they do shouldn't you at least consider doing the same?

Scan Me!

Skip the hassle of a local bow shop. They said it could not be done, but we did!

Our patented (U.S. Patent No. 12,405,080) process needs just 3 simple measurements and we can customize your bow to exactly what you need, and have it shipped to you without leaving your house.

HOW IT WORKS

Choose Your Bow*: Discover the perfect blend of technology and tradition with our extensive selection of compound bows.

SEND US YOUR SPECS

Enter your preferences such as draw weight, and measurements such as eye height.

WE SET IT UP

Accessories installed, cams timed, peep set and more by our certified master technicians.

WE SHIP IT

Your new bow will arrive tuned and tested. All you need to do is sight in and you're ready to shoot!

**Only applicable to bows shipped & sold by Pyramyd AIR*

DIANA
PERFORMANCE LINE

A PERFECT MATCH
SINCE DECADES

LP8 EVO² MAGNUM

Welcome the new generation of a real legendary.

The DIANA LP8 evo² Magnum is the successor of the legendary break barrel pistol DIANA LP8 Magnum. It succeeds the outstanding performance and minimize the weight. Due to the new polymer housing the new LP8 evo² Magnum saves >5% of weight and flatters the hands of the shooter all the more.

The new picatinny rail and slight changes on the housing design underline the modern an tactical design which is enriched by the 1/2" UNF barrel thread, covered by the front sight base.

The perfect made in Germany plinker spring air pistol, secure yours now!

AIR VENTURI BELL TARGET

By Tom Gaylord

Okay—you're a good shot, maybe even a great shot. But how do you know? You hit what you aim at. Yeah, but can you hit anything while standing on your feet?

What?

Air Venturi has brought to market a target that will make shooters honest just like scales and tape measures do for fishermen. The Air Venturi Bell Target is a way to prove you either “have it” or you left it at the curb some years ago.

Bell Target

The Air Venturi Bell Target is an affordable version of a target used in an indoor shooting sport known as bell target.

Simple

When you read about it or hear it you think anyone can do it. All you have to do is shoot through a hole in a metal target plate to ring a bell. The target is 21 feet away. How hard could it be? Well, it's hard enough that it became a pastime in pubs around Great Britain in the early 1900s.

And it's so simple. All you need is a quiet and lower-powered pellet gun to shoot through the hole and ring the bell.

The gun has to be accurate, or the pellet won't make it through the hole. Now sometimes part of the pellet will stop on the metal target faceplate at the edge of the hole and part will go through the hole to ring the bell. Is that a hit or not? Each shooting group gets to make up the rules they way they prefer.

What Airgun?

When I started testing this target, I discovered that I didn't really have many air rifles for the job. I don't need a scope, nor do I need 20-40 foot-pounds of energy. What I need is a rifle that can keep all my pellets inside a half-inch / 12.7mm when shot from 21 feet. It turned out that this target caused me to reassess my airgun collection. I have the same atom-smashers that most airgunners have these days, but I have very few small and lower-powered air rifles that are also accurate.

Hole Size

With the Air Venturi target you get two faceplates. One has a 3/8-inch / 9mm hole and the other has a 1/2-inch / 12.7mm hole. In the UK they have targets with holes of gradually larger dimensions, so everyone has a chance to ring the bell. But the bell target usually has a 9mm hole.

Lower-powered youth 10-meter target rifles like the Daisy 853 seem ideal for this target. They will ring the bell and have all the power that's needed.

Domed pellets are the pellets of choice for shooting the bell target. Wadcutters tend to hang up on the edge of the hole and other pellet shapes may not be accurate enough.

Price?

The Air Venturi Bell Target is priced at the bottom of what bell targets sell for worldwide. Some cost over \$250! So challenge yourself with the Air Venturi Bell Target!

It's Competition Time!
